MIT License

Template library providing functions for prime numbers generation.

1.1 Working with big numbers

Instead of standard unsigned integer types, any user-defined class may be used for `UIntType`. Class must define at least `=` `+` `&` `++` (prefix) `==` `<` `!=` `>` `%` `>>` `<<` `-` `*` operators and must provide `<<` stream operator (used for conversions), with the same behavior they have with standard unsigned integer types and must be interoperable with standard unsigned integer types. All library functions have been tested with GNU MP Bignum Library's `mpz_class`.

Chapter 2

Namespace Index

2.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

PrimeGen::Generators	
Prime generators	7
PrimeGen::Tests	
Primality tests	9
PrimeGen::Utils	
Various arithmetic functions used in library algorithms	10

Chapter 3

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

PrimeGen::Generators::random_prime_engine< UIntType, w, RandomNumberEngine, PrimarityTest >	
Random prime generator	13

Chapter 4

Namespace Documentation

4.1 PrimeGen::Generators Namespace Reference

Prime generators.

Classes

- class [random_prime_engine](#)
Random prime generator.

Typedefs

- template<typename UIntType , size_t w>
using [truly_random_prime_engine](#) = [random_prime_engine](#)< UIntType, w, std::random_device, [Tests::miller_rabin](#)< UIntType, 25 >>
Random prime generator.
- template<typename UIntType , size_t w>
using [pseudo_random_prime_engine](#) = [random_prime_engine](#)< UIntType, w, std::minstd_rand, [Tests::miller_rabin](#)< UIntType, 25 >>
Pseudorandom prime generator.

Functions

- template<class UIntType , uint_fast32_t accuracy>
UIntType [next_prime](#) (UIntType n)
Generates next prime greater than n.

4.1.1 Detailed Description

Prime generators.

4.1.2 Typedef Documentation

- 4.1.2.1 template<typename UIntType , size_t w> using PrimeGen::Generators::pseudo_random_prime_engine =
typedef random_prime_engine<UIntType, w, std::minstd_rand, Tests::miller_rabin<UIntType, 25>>

Pseudorandom prime generator.

Pseudorandom prime will be generated using `std::minstd_rand`. Probabilistic test is used for primarity testing, probability of false-positive composite is lower than $\frac{1}{4^{25}}$ while test is still reasonably fast.

Template Parameters

<i>UIntType</i>	Unsigned integer type. Must be able to hold 2 times maximum of <i>w</i> . (If <i>w</i> is 32 <code>UIntType</code> must be able to hold 64b numbers.)
<i>w</i>	Size of number to generate in bits. Generated number will be always greater than 2^{w-1} . <i>w</i> must be greater than 2.

See also

[Tests::miller_rabin](#)

4.1.2.2 `template<typename UIntType , size_t w> using PrimeGen::Generators::truly_random_prime_engine =
typedef random_prime_engine<UIntType, w, std::random_device, Tests::miller_rabin<UIntType, 25>>`

Random prime generator.

Random prime will be generated using `std::random_device`. Probabilistic test is used for primarity testing, probability of false-positive composite is lower than $\frac{1}{4^{25}}$ while test is still reasonably fast.

Template Parameters

<i>UIntType</i>	Unsigned integer type. Must be able to hold 2 times maximum of <i>w</i> . (If <i>w</i> is 32 <code>UIntType</code> must be able to hold 64b numbers.)
<i>w</i>	Size of number to generate in bits. Generated number will be always greater than 2^{w-1} . <i>w</i> must be greater than 2.

See also

[Tests::miller_rabin](#)

4.1.3 Function Documentation

4.1.3.1 `template<class UIntType , uint_fast32_t accuracy> UIntType PrimeGen::Generators::next_prime (UIntType n)`

Generates next prime greater than *n*.

Template Parameters

<i>UIntType</i>	Unsigned integer type. Must be able to hold 2 times size of <code>result</code> . Too bad no theory can estimate how exactly this prime will be big. From probabilistic theory you are pretty safe if <code>UIntType</code> can hold $3 \times (n + \ln(n))$.
<i>accuracy</i>	Since probabilistic test is used for primarity testing, this parameter determines accuracy of the test. Reasonable values are 25 – 50 which gives probability of false-positive composite lower than $\frac{1}{4^{25}}$ while test is still reasonably fast.

See also

[Tests::miller_rabin](#)

Parameters

<i>n</i>	Generated prime will be greater than <i>n</i> . <i>n</i> must be greater than 3.
----------	--

Returns

Prime greater than *n*. There should be no other primes between *n* and generated prime (see [accuracy](#)).

4.2 PrimeGen::Tests Namespace Reference

Primality tests.

Functions

- `template<class UIntType , size_t accuracy>`
`bool miller_rabin (const UIntType &n)`
Miller-Rabin probabilistic primality test.
- `template<class UIntType , size_t w = std::numeric_limits<UIntType>::digits>`
`bool miller_rabin_deterministic (const UIntType &n)`
Miller-Rabin deterministic primality test.
- `template<class UIntType >`
`bool f100_prime_factors (const UIntType &n)`
Quick test, testing only first 100 prime factors.
- `template<class UIntType >`
`bool f1000_prime_factors (const UIntType &n)`
Quick test, testing only first 1000 prime factors.

4.2.1 Detailed Description

Primality tests.

4.2.2 Function Documentation

4.2.2.1 `template<class UIntType > bool PrimeGen::Tests::f1000_prime_factors (const UIntType & n)`

Quick test, testing only first 1000 prime factors.

Template Parameters

<i>UIntType</i>	Unsigned integer type.
-----------------	------------------------

Parameters

<i>n</i>	number to be tested for primarity
----------	-----------------------------------

Returns

`true` if no prime factor was found, `false` otherwise. This test does not guarantee number to be prime, it should be used only together with other tests or for testing very small numbers.

4.2.2.2 `template<class UIntType > bool PrimeGen::Tests::f100_prime_factors (const UIntType & n)`

Quick test, testing only first 100 prime factors.

Template Parameters

<i>UIntType</i>	Unsigned integer type.
-----------------	------------------------

Parameters

<i>n</i>	number to be tested for primality
----------	-----------------------------------

Returns

`true` if no prime factor was found, `false` otherwise. This test does not guarantee number to be prime, it should be used only together with other tests or for testing very small numbers.

4.2.2.3 `template<class UIntType , size_t accuracy> bool PrimeGen::Tests::miller_rabin (const UIntType & n)`

Miller-Rabin probabilistic primality test.

Template Parameters

<i>UIntType</i>	Unsigned integer type. Must be able to hold 2 times size of <i>n</i> . (Even if <i>n</i> would fit in 32b type <code>UIntType</code> must be able to hold 64b number.)
-----------------	--

Parameters

<i>n</i>	Number to be tested for primality. Must be greater than 3.
<i>accuracy</i>	Since this is only probabilistic test, test has its accuracy determined by this parameter. Probability of false-positive match is only $\frac{1}{4^{accuracy}}$. Prime will be always determined as prime. Reasonable values are 25 – 50 which gives probability of false-positive composite lower than $\frac{1}{4^{25}}$ while test is still reasonably fast.

Returns

`true` if number is probable prime, `false` if number is definitely composite.

4.2.2.4 `template<class UIntType , size_t w = std::numeric_limits<UIntType>::digits> bool PrimeGen::Tests::miller_rabin_deterministic (const UIntType & n)`

Miller-Rabin deterministic primality test.

This test depends on (unproved in time of writing) generalized Riemann hypothesis. Don't use this test if dependency on unproved theories is unacceptable for you.

Template Parameters

<i>UIntType</i>	Unsigned integer type. Must be able to hold 2 times size of <i>n</i> . (Even if <i>n</i> would fit in 32b type <code>UIntType</code> must be able to hold 64b number.)
-----------------	--

Parameters

<i>n</i>	Number to be tested for primality. Must be greater than 3.
----------	--

Returns

`true` if number is probable prime, `false` if number is definitely composite.

4.3 PrimeGen::Utils Namespace Reference

Various arithmetic functions used in library algorithms.

Functions

- `template<class UIntType >`
`std::pair< UIntType, UIntType > fac_2_powers (const UIntType &n)`
Factorize powers of 2 from n.
- `template<class UIntType >`
`UIntType pow_mod (UIntType base, UIntType exp, const UIntType &mod)`
Exponentiation over a modulo. Exponentiation will be done by repeated squaring.
- `template<class UIntType , size_t w>`
`double log (const UIntType &n)`
Logarithm function.
- `template<class UIntType , class EngineType , size_t w>`
`UIntType independent_bits_generator (EngineType &_32b_generator)`
Generates random number using provided engine. Randomness of generated number depends on randomness of provided engine.

4.3.1 Detailed Description

Various arithmetic functions used in library algorithms.

4.3.2 Function Documentation

4.3.2.1 `template<class UIntType > std::pair< UIntType, UIntType > PrimeGen::Utils::fac_2_powers (const UIntType & n)`

Factorize powers of 2 from n.

Template Parameters

<i>UIntType</i>	Unsigned integer type.
-----------------	------------------------

Parameters

<i>n</i>	number to be factorized
----------	-------------------------

Returns

`std::pair (s, d)` where s, d holds $n = 2^s \times d$

4.3.2.2 `template<class UIntType , class EngineType , size_t w> UIntType PrimeGen::Utils::independent_bits_generator (EngineType & _32b_generator)`

Generates random number using provided engine. Randomness of generated number depends on randomness of provided engine.

Template Parameters

<i>UIntType</i>	Unsigned integer type. Must be able to hold w long numbers
<i>EngineType</i>	Function support all standard engine types defined in <code><random></code> , including <code>std::random_device</code> . (Hence all classes generating 32b numbers with <code>()</code> operator should work). Internal state of engine will be modified. Engine must be initialized and provide <code>()</code> operator generating 32b numbers.

<i>w</i>	size of number to generate in bits
----------	------------------------------------

Parameters

<i>_32b_generator</i>	Initialized number generator
-----------------------	------------------------------

Returns

`std::pair (s, d)` where s, d holds $n = 2^s \times d$

4.3.2.3 `template<class UIntType, size_t w> double PrimeGen::Utils::log (const UIntType & n)`

Logarithm function.

Computes logarithm with maximum precision available for standart types. **UIntType** must be able to print itself to stream (ie. stream operator << must bbe defined)

Template Parameters

<i>UIntType</i>	Unsigned integer type.
<i>w</i>	size of n in bits

Parameters

<i>n</i>	number to compute logarithm for
----------	---------------------------------

Returns

natural logarithm of n

4.3.2.4 `template<class UIntType > UIntType PrimeGen::Utils::pow_mod (UIntType base, UIntType exp, const UIntType & mod)`

Exponentiation over a modulo. Exponentiation will be done by repeated squaring.

Template Parameters

<i>UIntType</i>	Unsigned integer type. Must be able to hold 2 times size of <code>base</code> and <code>mod</code> . (Even if <code>base</code> would fit in 32b type <code>UIntType</code> must be able to hold 64b number.)
-----------------	---

Parameters

<i>base</i>	
<i>exp</i>	exponent
<i>mod</i>	modulo

Returns

$(base^{exponent}) \% modulo$

Chapter 5

Class Documentation

5.1 PrimeGen::Generators::random_prime_engine< UIntType, w, RandomNumberEngine, PriorityTest > Class Template Reference ↩

Random prime generator.

```
#include <primegen.h>
```

Public Types

- typedef UIntType **result_type**

Public Member Functions

- template<typename... Args>
 random_prime_engine (Args &&...args)
 *Constructs **random_prime_engine** with underlying RandomNumberEngine.*
- result_type **operator()** ()
 Generates prime.
- const RandomNumberEngine & **base** () const

Static Public Member Functions

- static constexpr result_type **min** ()
 Returns the minimum value potentially generated by the random-number engine.
- static constexpr result_type **max** ()
 Returns the maximum value potentially generated by the random-number engine.

5.1.1 Detailed Description

```
template<class UIntType, size_t w, class RandomNumberEngine, bool(&)(const UIntType &) PriorityTest>class PrimeGen::↩  
Generators::random_prime_engine< UIntType, w, RandomNumberEngine, PriorityTest >
```

Random prime generator.

Random prime will be generated using given RandomNumberEngine.

Template Parameters

<i>UIntType</i>	Unsigned integer type. Must be able to hold 2 times maximum of <i>w</i> . (If <i>w</i> is 32 <i>UIntType</i> must be able to hold 64b numbers.)
<i>w</i>	Size of number to generate in bits. Generated number will be always greater than 2^{w-1} . <i>w</i> must be greater than 2.
<i>RandomNumberEngine</i>	Engine used as base for generating random numbers. Entropy provided by this engine directly affects entropy of generated primes (ie. quality of this engine is really important)
<i>PrimarityTest</i>	Test used for primarity testing. First fast test for 1000 first primes is applied on generated number, then <i>PrimarityTest</i> is runned. No further testing is done, use with caution.

See also

[Tests::miller_rabin](#)

Parameters

<i>args</i>	Arguments passed to constructor of <i>RandomNumberEngine</i> .
-------------	--

Returns

Randomly (randomness depends on *RandomNumberEngine* and its arguments) generated prime number.

5.1.2 Constructor & Destructor Documentation

5.1.2.1 `template<class UIntType , size_t w, class RandomNumberEngine , bool(&)(const UIntType &) PrimarityTest>
template<typename... Args> PrimeGen::Generators::random_prime_engine< UIntType, w,
RandomNumberEngine, PrimarityTest >::random_prime_engine (Args &&... args) [inline]`

Constructs [random_prime_engine](#) with underlying *RandomNumberEngine*.

Parameters

<i>args</i>	Arguments passed to underlying <i>RandomNumberEngine</i>
-------------	--

5.1.3 Member Function Documentation

5.1.3.1 `template<class UIntType , size_t w, class RandomNumberEngine , bool(&)(const UIntType &) PrimarityTest> static
constexpr result_type PrimeGen::Generators::random_prime_engine< UIntType, w, RandomNumberEngine,
PrimarityTest >::max () [inline], [static]`

Returns the maximum value potentially generated by the random-number engine.

Returns

The maximum potentially generated value.

5.1.3.2 `template<class UIntType , size_t w, class RandomNumberEngine , bool(&)(const UIntType &) PrimarityTest> static
constexpr result_type PrimeGen::Generators::random_prime_engine< UIntType, w, RandomNumberEngine,
PrimarityTest >::min () [inline], [static]`

Returns the minimum value potentially generated by the random-number engine.

Returns

The minimum potentially generated value.

5.1.3.3 `template<class UIntType , size_t w, class RandomNumberEngine , bool(&)(const UIntType &) PrimarityTest> auto
PrimeGen::Generators::random_prime_engine< UIntType, w, RandomNumberEngine, PrimarityTest
>::operator()() [inline]`

Generates prime.

Generates a random (randomness depends on `RandomNumberEngine`) prime. The state of the engine is advanced by one position.

Returns

A random prime in [[min\(\)](#), [max\(\)](#)].

The documentation for this class was generated from the following file:

- `primegen.h`
